

Digital4nx Group, Ltd.

Boutique-Style Expert Digital Forensics Services

“
I’ve called it a Digital Autopsy for nearly 20 years so the best lawyers and their Clients can easily understand what we can do
”

Founded as a boutique firm in 2013, Digital4nx Group, Ltd. offers digital litigation support services, including digital forensic investigations and cyber security services. The firm’s expert forensic examiners hold decades of experience in helping all sized companies and litigation attorneys recover deleted files, text messages, web-based artifacts, and other electronic evidence used to reconstruct the timeline, analyze, and interpret relevant data from most

systems or mobile devices. “I’ve called it a Digital Autopsy for nearly 20 years so the best lawyers and their clients can easily understand what we can do,” mentions Rob Kleeger, Founder and Managing Director, Digital4nx. He further notes that businesses have typically remained focused on outsider threats. But they often fail to recognize that greater threats may come from within—from their employees.

Digital4nx has a comprehensive understanding of different insider thefts and typical human behavior. That’s why, with its expert digital forensic investigation service, the attorney is enabled to provide their clients with all the crucial information that they can use to settle or win any legal battle. For example, if an employer suspects an ill-intentioned employee has misused their information after joining its competitor, Digital4nx reconstructs the timeline to find out what steps he/she had been taking or what files were being accessed, misappropriated, or copied weeks or months prior to their resignation. The company provides this service both on a fixed-fee and hourly-fee hybrid model. More importantly, Digital4nx

Rob Kleeger,
Founder & Managing Director

always serves clients, regardless of size and the “stakes” of the matter. Kleeger adds, “We always focus on balancing the client’s cost and balancing against the most efficient approach.” To this end, the company works closely with attorneys to understand the requirements and value of a case and engage accordingly.

On the proactive side, Digital4nx offers its cyber security services like Advanced Ethical Hacking and Information Security Policy consulting and Cyber Risk Assessment (CRA). The company provides clients with a comprehensive review of their internal and external or wireless networks, the web applications they built and/or use. This is not simply a penetration test. They use high-level techniques to the level of an Advanced Persistent Threat (APT). An APT is a sustained and targeted attack that uses high-level and covert tactics. This is one of the areas where Digital4nx’s Cyber team excels over the competition. As an independent third party, they offer remediation guidance to assist clients

in improving their overall security hygiene. “We ethically hack clients’ people, process, and technology. We aim to identify the data that might come under various legal or regulatory obligations to better protect their “crown-jewels” “.In addition to leveraging the firms significant legal experience and perspective, they use various cybersecurity frameworks that ensures effective compliance, mitigates risks, and incorporates the requirements of many data security regulations, industry standards, and requirements. They provide a roadmap for their regulatory, compliance, insurance, or contractual obligation needs. This enables Digital4nx to reverse engineer the business policies and procedures to reveal the overall risk factors. “Just so there are no surprises, we do this on a Fixed Fee basis,” mentions Kleeger. Digital4nx also offers post-breach incident response investigation consultation on possible data breaches due to a socially engineered Phishing attack, Fraudulent Wire Transfer, Business Email Compromise, and other malicious attacks.

...Bridging the Legal and Technology Gap

What enables Digital4nx to offer such comprehensive services is its nimble team of subject matter experts. They also have the knowledge of all the legal liabilities whenever a case reaches the court. This team is passionate about what it does and works round the clock to help clients succeed.

Digital4nx is planning to bring a solution to help reputed individuals clean up all the publicly available information about themselves and their families to avoid easily targeted attacks. In this context, Kleeger mentions that bad actors have access to a tremendous amount of data at their fingertips. They use it to socially engineer any type of attack both on the surface web and the dark web. “Our goal is to make people understand that personal cybersecurity hygiene makes their professional life more frictionless,” he adds.

In a nutshell, Digital4nx provides cyber awareness for all individuals knowing it will play a vital role in eliminating the possibility of confidential data theft and make individuals less susceptible to advanced socially engineered attacks. **ES**
